

KaarigarAI — Screen Wireframes

Six screens · low-fidelity, deliberately · the whole product claim is an interface for someone who cannot read, so it has to be drawn

Each tile speaks its own name when touched.
No language list is read. Nothing on this screen must be understood in writing to get past it — the script glyph is recognition, not reading. Language stays changeable here later.

One button that cannot be mistaken for anything else.
Framing brackets replace the instruction "centre the product". Retake prompts are spoken, not written. The green strip means saved-and-queued — capture never depends on a network.

Grey bars = text the artisan is NOT expected to read.
Every grey bar has a speaker button beside it.
Minimum touch target drawn at 64 px.

Confirmation is the whole design, in one screen.
The listing text exists but is never required reading — she presses play and hears it. Two outcomes only: it's right, or say it again. No editing, no keyboard, nothing to type.

SHAP as three bars, not a table.
A band, never a single false-precision number. The floor is visible and explained in the two words that matter — material and labour — and it warns without seizing her decision.

Two buttons. A number she can read. Nothing else.
Offers carry fixed fields — price, quantity, date — so no translation is needed to act. The shield line is the lowball protection made visible: she sees that it worked, not the abuse.

The only screen where reading is assumed.
Buyers are boutique owners, exporters and procurement staff — so this side is ordinary and plain on purpose. Two sides in one demo is what most submissions never show.
